

Social Innovation and Technological Transition for Sustainable Development

In the process of industrialization and modernization, social innovations (innovations in economic and financial mechanisms, subsidy systems, etc.) and technological transitions (development of renewable energy, AI technologies, etc.) have a significant impact on social development and also provide opportunities to achieve sustainable development. Adaptation and co-evolution between social innovation and technology transitions is a central academic issue and a common challenge for Japan, China and Korea. This workshop aims to promote the realization of sustainable social development through interdisciplinary research exchange across the fields of socio-economics, energy, public health and complex system sciences.

Tsinghua University (Professor Jin Chen's laboratory), Seoul National University (Professor Keun Lee's laboratory), and The University of Tokyo (Professor Yu Chen's laboratory) are the main initiators to promote the interaction of relevant scholars from Japan, China, and South Korea by holding workshops and inter-university exchanges.
